

ABSTRACT OF THE DISCLOSURE

A washing machine includes an inner tub rotatably mounted within an outer tub having a rear wall portion and a main body portion. A balancing fluid reservoir is molded to an upper region of the main body portion of the outer tub. The reservoir includes an opening leading to a plurality of fluid delivery channels molded along the rear wall portion of the outer tub. Preferably two channels are molded into the outer tub for delivering the balancing fluid to the inner tub, and a third channel for returning the balancing fluid to the reservoir. A cover plate, having a pair of receiver openings for injector valves, is positioned to close off the first, second and third channels.
